A Mathematical Introduction to Fluid Mechanics. Alexandre J. Chorin, Jerrold E. Marsden. The goal of this text is to present some of the basic ideas of fluid mechanics in a mathematically attractive manner, to present the physical background and motivation for some constructions that have been used in recent mathematical and numerical work on the Navier-Stokes equations and on hyperbolic systems and to interest some of the students in this beautiful and difficult subject.

Fluids are studied in a mathematical manner so that much that remains uninvestigated in standard fluids texts is revealed here. A typical example is the local decomposition of a velocity vector described in terms of the deformation tensor at an early stage in the book and is closely related to the well known Helmholtz decomposition.

A MATHEMATICAL INTRODUCTION TO FLUID MECHANICS 3 The cross product is only between two vectors in three space dimension. Let $v = (v_1; v_2; v_3)$, $u = (u_1; u_2; u_3) \in \mathbb{R}^3$. Then the cross produce is defined by $v \times u = (v_2u_3 - v_3u_2; v_1u_3 - v_3u_1; v_1u_2 - v_2u_1)$: (0.5) It is convenient to consider the operator for the gradient as $r = (\partial_x; \partial_y; \partial_z)$. Then, $rc = \partial_x c; \partial_y c$

Introduction. These notes are based on a one-quarter (i. e. very short) course in fluid mechanics taught in the Department of Mathematics of the University of California, Berkeley during the Spring of 1978. The goal of the course was not to provide an exhaustive account of fluid mechanics, nor to assess the engineering value of various approximation procedures.
